## Monitoring Technique

VARIMETER
Speed Monitor
BA 9055, AA 9050

## Product Description

The speed monitors BA 9055 and AA 9050 monitors the rotational speed of motors. They recognise and monitor impulse signals of proximity sensors and protect machines and produced material or allows speed depending switching in production processes.

Function Diagram

## Circuit Diagram

BA 9055.11, AA 9050.11

- According to IEC/EN 60255-1
- Detection of
- Underspeed
- Overspeed
- Standstill
- Adjustable response value
- BA 9055 with adjustable start-up delay
- AA 9050 with adjustable hysteresis
- Width 45 mm

## Approvals and Markings

*) Only BA 9055

## Applications

Speed monitors are used in case where it is necessary not to exceed certain speed limits in order to protect plants and products against damage. The Speed monitors are used on conveyors, transfer lines as well as plants where several drives with a certain speed have to work together.

## Function

The measuring principle is to compare frequencies. With a proximity sensor the speed is converted to a speed proportional frequency. This frequency is compared to an internal adjustable frequency reference. If the measured frequency is higher then the reference the output relay is energized on an underspeed monitor or de-energized on an overspeed monitor. The output relay deenergises on an underspeed monitor if the speed goes under the setted hysteresis value. On the overspeed monitor the relay is energized. The reaction time is rather short, as the unit has no intergrating function. To calculate refer to formula in Function Diagram. The power supply for the proximity sensor is built into the unit. The input is designed for pnp sensors. The speed monitor has an integrated start-up delay. The unit is delivered with a bridge between terminals $\times 3-\times 4$. The start-up delay is activated when the power supply is connected to A1-A2.
For the start- up time the output relay is energized. If no start-up delay is required, the bridge must be removed. The start-up delay can be activated also by external contacts connected to X3-X4.
The start-up delay normally is not required with overspeed monitoring. An LED indicates the connected power supply. A second LED indicates the state of the output relay.
Connection Terminals

| Terminal designation | Signal description |
| :--- | :--- |
| A1 | L/ + |
| A2 | N - |
| ,+ 0 | Current supply proximity sensors |
| n | Measuring input |
| X3, X4 | Programming terminals |
| $11,12,14$ | Speed indicator relay (two-way contact) |
