Latching Relay
MK 8852

## Product Description

The latching relay MK 8852 is suitable for use in systems in which the switching states of the contacts must be reliable mainteined even in the event of power failures. It contains a bistable relay equipped with two coils, which permanentely maintains its switching state after pulse triggering. The latching relay is designed for pulse operation, although continuous operation is also permissible in the event of a fault. Switching of the contacts can be achieved by pulse control of the other second relay coil. The switching position of the contacts can be changed manually, with the manual actuator on the front of the device, which also serves as a contact position indicator.

## Your Advantage

- Energy saving, no holding capacity required
- Manual switching by manual actuator possible
- Switching position visible from outside

## Features

- According to IEC/EN 61810-1
- Setting input A1-A2
- Reset input A3-A2
- Storage function
- Switch position indication
- Manual operation
- DIN rail mounting
- Width 22.5 mm

## Approvals and Markings

## Notes

Impulse conversion into a permanent function. (A pulse input s leading to a continuous function output).

Latching relays are designed for pulse operation.
In case of cyclic pulsed operation, the recommended pulse duration for $t_{s}$ and $t_{r}$ are within $0.03 \ldots 2$ s each. A pulse-interval-ratio of $25 \%$ duty cycle is recommended. In no case the permissible operating frequency may be exceeded. For single pulse operation pulse times of $>2 \mathrm{~s}$ are possible. A recovery time ( min off time between 2 impulses) of $>6 \mathrm{~s}$ is required.

In case of a failure a continuous control is possible.
Simultaneous energization of A1 and A3 ist not allowed!
